EFT of Inflation New inflation Fluctuations and initial conditions

MCMC analysis of current data **plus** Ginsburg-Landau stability arguments point to double–well type potentials with the inflaton  $\phi$  rolling from a region of negative curvature near  $\phi = 0$  (the "false vacuum") toward the true absolute minimum  $\phi_{min}$  of the potential where  $v(\phi_{min}) = v'(\phi_{min}) = 0$ .

In general

$$v(\phi) = \phi_{min}^2 F(\phi/\phi_{min})$$

with 
$$F(x) \simeq F_0 - \frac{1}{2}x^2$$
 as  $x \to 0$ .

For instance BNI (Binomial New Inflation)

$$F(x) = \frac{1}{4}(x^2 - 1)^2$$

EFT of Inflation New inflation Fluctuations and initial conditions

#### Once upon a time ...

in the matter dominated era there was a very low quadrupole that would later (now) become a very low  $\ell = 22$  multipole.

The argument based on fastroll to explain such a low quadrupole would have given  $N_{tot} = 61$  but would have been proven wrong later on, when more superhorizon modes reentered. Except that ...

#### The entropy lower bound

$$N_{tot} \ge 63 + \frac{1}{2} \log \frac{H}{10^{-4} M_{PL}} - \frac{1}{12} \log \frac{g_{reh}}{1000} \simeq 63$$

We live when the homogeneity and entropy lower bound coincide!

#### Once upon a time ...

The MCMC method produces sequences distributed as  $L(\lambda)$  (× the prior probability), through an acceptance/rejection one-step algorithm (*e.g.* Metropolis)

$$W(\lambda^{(k+1)}, \lambda^{(k)}) = g(\lambda^{(k+1)}, \lambda^{(k)}) \min\left\{1, \frac{L(\lambda^{(k+1)})g(\lambda^{(k+1)}, \lambda^{(k)})}{L(\lambda^{(k)})g(\lambda^{(k)}, \lambda^{(k+1)})}\right\}$$

runs made with CosmoMC on a Linux cluster (Turing) with 8 to 16 parallel chains, repeated up to 4 times for each setup, with R - 1 < 0.03

Cosmological MCMC MCMC likelihoods Best fit comparisons

## The setup

- Observational CMB data  $\implies$  likelihood on  $C_{\ell}^{(model)}$ ;
- Model with cosmological parameters  $\lambda = \{\lambda_1, \lambda_2, \dots, \lambda_n\} \Longrightarrow C_{\ell}^{(model)}(\lambda)$ (CMBFAST, CAMB,...);

 $\Rightarrow \quad \text{likelihood } L(\lambda) = \exp[-\chi^2(\lambda)/2]$ 

The **MCMC** method produces sequences distributed as  $L(\lambda)$  (× the **prior probability**), through an acceptance/rejection one-step algorithm (*e.g.* **Metropolis**)

$$W(\lambda^{(k+1)}, \lambda^{(k)}) = g(\lambda^{(k+1)}, \lambda^{(k)}) \min\left\{1, \frac{L(\lambda^{(k+1)})g(\lambda^{(k+1)}, \lambda^{(k)})}{L(\lambda^{(k)})g(\lambda^{(k)}, \lambda^{(k+1)})}\right\}$$

Binomial New Inflation with sharpcut or (simplified) fastroll C.D., H.J. de Vega, N. Sanchez, Phys. Rev. D78

### Simplification

- Born's approximation for k not too small.
- $k_{tran} = -1/\eta_0$  is the comoving wavenumber that exits the horizon when fast-roll ends and slow-roll starts.

Is the low CMB TT quadruple too low? Theoretical setup MCMC analysis Summary

Cosmological MCMC MCMC likelihoods Best fit comparisons

#### Highlight

#### The quadrupole wavenumber

 $k_Q \simeq 0.83 k_{tran}$  and exits roughly 1/10 of an efold before  $k_{tran}$ 

#### The number of inflation efolds

$$N_{slowroll} \simeq 63$$
 ,  $N_{tot} \simeq 64$ 

<ロ><日><日><日</th>

- Large scale CMB anisotropies provide information on the beginning of inflation.
- Early fast-roll inflation is generic and provides a mechanism for lowest multipoles depression.
- BNI+fastroll significantly improves the fit w.r.t.  $\Lambda CDM + r$ .
- BNI+fastroll improves the fits also w.r.t. BNI+sharpcut.
- Fast–roll depression of the quadrupole sets to  $\sim$  64 the total number of inflation efolds.

## Outlook

- Improve the EFT of inflations (entropy, reheating, ...
- Wait for better data (Plank, ACT, ...]
- Refine, refine, refine

- Large scale CMB anisotropies provide information on the beginning of inflation.
